## MEMORANDUM

To: Transportation Commission
From: Joel Pfundt, AICP CTP, Transportation Manager
Victoria Kovacs, AICP, Transportation Planner
Brett Schock, PE, AICP, RSP2i, Transpo Group
Date:
September 22, 2022
Subject: Lake Street S/Lake Washington Boulevard NE Promenade Analysis and Concept Development Study

## I. RECOMMENDATION:

It is recommended that the Transportation Commission receive an update on the Lake Street S/Lake Washington Boulevard NE Promenade Analysis and Concept Development Study.

Staff and Consultant Transpo Group seek input from the Commission on the candidate crosssection options for the Promenade, potential evaluation criteria, and potential on-street parking management strategies.

## II. BACKGROUND DISCUSSION:

## A. Introduction

Lake Street South/Lake Washington Boulevard NE is a key multimodal corridor connecting downtown Kirkland south to Bellevue, SR 520, and to the King County Regional Leafline Trails system via the SR-520 Trail. It is also a part of the Lake Washington Loop, a signed 48-mile bicycle route which connects Kirkland, Bellevue, Renton, Seattle, Lake Forest Park, Kenmore, and Bothell. The segment of the corridor between 2nd Avenue South and Lakeview Drive is particularly unique along the Lake Washington Shoreline as it connects downtown Kirkland, Carillon Point, and several City parks in a segment less than a mile, including David E. Brink Park, Marsh Park, Doris Cooper Houghton Beach Park, as well as smaller parks providing waterfront access including the 2nd Avenue South Dock, Street End Park, and Settler's Landing. For this reason, Lake St S/Lake Washington Blvd is a popular scenic walk frequented by people from Kirkland and throughout the region.

Since 2014 there has been expressed public interest and Council discussion of a Promenade along Lake Washington Boulevard. In 2015 the Council adopted the 2035 Transportation Master Plan which recognized the rich walking environment of this corridor and explicitly identified the need for a planning study for a potential lake front Promenade.

Recently, there was renewed community interest in widening the pedestrian space of Lake St S/Lake Washington Blvd NE for social distancing during the height of the COVID19 pandemic as a pilot parking lane closure which could inform a potential permanent Promenade. The Transportation Commission unanimously approved a motion in support of implementing a pilot project in the March 2021 meeting. However, the pilot project was ultimately not pursued given the high cost of a temporary installation, and City Council expressed need for fuller understanding of the baseline safety concerns, bicycle and pedestrian use, and parking utilization of the corridor prior to conducting a pilot project.

To address Council feedback in May, a two-step process was proposed by the City Manager and Staff to further evaluate creating a Promenade pilot along the Lake Washington waterfront, which was approved by Council within the June 2021 budget ordinance. The first step was to perform baseline data collection study to better understand how people are using the corridor. This analysis was presented to Transportation Commission during the September 2021 meeting, and the final report memo completed in December 2021 is included as Attachment B. The second step is to take the results of the analysis and develop design concepts for a new Promenade along the Lake Washington waterfront that addresses the issues and needs in the corridor. Transpo Group was selected as the consultant to complete this study through the City's procurement process. Information developed through the two-step planning process will inform a Council decision in spring of 2023 of how to proceed with the Promenade concept.

## B. Study Purpose

Given the unique placemaking, recreational and transportation value of Lake St S/Lake Washington Blvd NE as well as flexibility to adjust existing parking supply given the baseline data collection parking utilization findings, there is opportunity to better allocate existing right-of-way for balanced, multimodal use of the corridor. The purpose of this study is to conduct further analysis to identify constraints and opportunities in the existing roadway design, and to develop and evaluate street design alternatives to improve the comfort of walking, cycling and rolling along Lake Street S/Lake Washington Boulevard to attract more people to Kirkland's signature waterfront.

The extents of this corridor study are from 2nd Avenue South to Lakeview Drive.

## C. Requested Transportation Commission Input

This memorandum represents a progress update to the Transportation Commission on the Promenade Analysis and Concept Development study. The update includes information on:

- Existing conditions identified by Transpo Group
- A summary of crash history, safety analysis conducted under the data collection study, and safety-related citizen requests received by the City within the project corridor
- The range of street cross-section options identified by Transpo Group
- Preliminary work to apply cross-sections to various locations within the corridor
- A range of options for addressing reduction in on-street parking

Staff and Transpo Group are seeking the Transportation Commission's feedback on progress to date and any input on preferences or concerns with:

- Identified candidate cross-section options for the Promenade
- Evaluation criteria for cross-sections and alternative corridor layouts for the Promenade
- Parking management strategies

Staff and Transpo Group will return to Transportation Commission in December of 2022 with a completed analysis of options. At that time, feedback from the Transportation Commission will be incorporated into the analysis before the evaluation of options is presented to the Kirkland City Council in early 2023.

## III. EXISTING CONDITIONS ANALYSIS:

Transpo conducted an in-depth review of the existing conditions in the corridor, including existing data review and field visits. The objective of the existing conditions review was to understand the existing assets and identify opportunities for pedestrians, bikes, vehicles, parking, and infrastructure supporting residences and businesses along the corridor. The existing conditions review also collected information on the existing lighting system, including a nighttime visit to assess lighting conditions after sundown, and a model of lighting levels to compare to standards and ideal conditions, given the desired target user in the corridor.

## A. User Mix

Lake Street S/Lake Washington Boulevard NE has a diverse mix of users of all modes. The project corridor has three major public parks with waterfront access, attracting many younger children, their families, pets, strollers, and less confident cyclists. The parks also attract recreational use and exercise in the corridor by a wide range of ages and abilities. Many residences, including multifamily apartment complexes front on Lake Street S/Lake Washington Boulevard NE and residents can easily access downtown Kirkland by foot or bike via the corridor. There are assisted living facilities that front onto the corridor which house individuals with mobility challenges who still use the corridor for exercise and park access. The corridor is part of the Lake Washington Loop, so is frequented by cyclists of a high level of comfort who enjoy elevated cycling speeds compared to the typical multigenerational user mix. In addition to the wide range of active mode users, Lake Street S/Lake Washington Boulevard NE is a significant arterial corridor for Kirkland. Vehicle volumes vary from 5,000 vehicles per day on the north end of the corridor to 15,000 vehicles per day near the intersection with Lakeview Drive.

## B. Existing Roadway and Sidewalks

The existing curb to curb pavement on Lake Street S/Lake Washington Boulevard NE is typically 44 feet wide, with some widening at intersections. The typical section throughout the project limits includes two parking lanes, two vehicle lanes (one in each direction) and two marked one-way bike lanes. The existing parking lanes are typically 7 feet wide, the bike lanes are 5 feet wide with no marked buffers, and the vehicle lanes vary between 10.5 and 9.5 feet, with most areas 10 feet in width. There is one signalized intersection within the project limits. The signal at Lake Washington Boulevard and Lakeview Drive defines the southern limit of the project corridor.

Behind the existing curbs, there are sidewalks present on both sides of the roadway. The sidewalks on the west side are typically 10 feet wide between 2nd Ave S and 10th Ave S. Between 10th Ave S and NE 62nd St, west side sidewalks drop to an average of 6 feet in width, except for the recently widened sidewalks at David E Brink Park. South of NE 62nd Street, west side sidewalks widen back out to 10 feet in width to the signal with Lakeview Drive. The existing sidewalk on the east side of the road is 5 feet in width for the entirety of the corridor.

Some of the sidewalk width on both sides of the street is beyond the right of way and includes the entry plazas and frontage improvements of residential and commercial buildings that front on the roadway.

Street trees are present in some locations, some near the curb line and others nearer the right of way line. Street trees are more plentiful, but in less regular configuration, between 2nd Ave $S$ and 5th Ave S, having been installed as development occurred. Between David E Brink Park and 10th Ave S, there are more regularly spaced, mature trees at the curb line. South of 10th Ave S, street trees are present mostly just at Marsh and Houghton Beach Parks.

Some of the existing curbs in the corridor are heavily damaged. Recent redevelopment has damaged some curbs, and long-term maintenance needs have also resulted in some curb deterioration. Sidewalks near street trees whose roots have infiltrated subbase layers are cracked and lifted, presenting mobility challenges, and an uneven walking surface that does not meet ADA guidelines in some areas.

## C. Right-of-Way

The right of way in the project corridor varies slightly, but is no less than 60 feet. The variations in the right of way are due to changes in the timing and policies for frontage improvements and right of way dedication as the residences and commercial properties along the corridor have developed. The City's goal for the current study is for all modifications to occur within the existing right of way limits.

## D. Existing Land Use and Development

Along Lake Street S and Lake Washington Boulevard NE, the land use is urbanized. There is little undeveloped land on the east or west side of the road. Lake Washington is between 100 and 300 feet to the west of the roadway. Lake access, views, and proximity to Downtown Kirkland make the corridor a highly sought-after residential location. A mix of residence types, with a majority multifamily units, are present on both sides of the street. There are some commercial facilities, including restaurants, offices, and assisted living facilities. Many of the residential buildings have mature landscaping, with well-developed aesthetic treatments including fountains, gardens, terraces and plazas.

## E. Residential Support Facilities

Along the corridor, day to day support facilities for residences, including mailboxes and locations for trash pickup, are significant considerations when looking to change the roadway section. Support facilities are more plentiful between 2nd Ave S and 5th Ave S on the north end of the corridor, and between 10th Ave S and Marsh Park. Maintaining access to existing mailboxes at the back of the sidewalk, dumpsters for multifamily units, and single family homes that require placement of and pickup of garbage and recycle cans near the curb will need to be considered in the configuration of a promenade facility. Additionally, the ubiquity of delivery services, especially after the COVID-19 pandemic, for everything from packages to meals to rideshare will mean curb access on both sides of Lake Washington Boulevard will need to be considered.

## F. Public Parks

Several public parks are within the study limits. Houghton Beach Park, Marsh Park and David E Brink Park are all heavily used public facilities with waterfront access, including docks for kayaking at Houghton Beach Park, sports facilities, playgrounds and public art installations. Settler's Landing, Street End Park, and the $2^{\text {nd }}$ Ave S Dock are all smaller parks providing waterfront access. The parks are an asset to the community and a significant driver of the active mode usage in the corridor by users of a wide range of ages and comfort levels at all times of the day.

In addition to the public parks, a semi-public walkway exists along the waterfront, through the otherwise private multifamily residential properties within the project corridor. The walkway does get restricted at night, via gates at the private property entrances, but is available during daylight hours as a walking alternative to the sidewalks along the roadway.

## G. Crosswalks

There are 10 existing unsignalized marked crossings of Lake Street S/Lake Washington Boulevard NE within the project limits including the crossing at $2^{\text {nd }}$ Ave S, and an additional marked crossing on the north leg of the signalized intersection of Lake Washington Boulevard NE and Lakeview Drive. None of the existing marked crossings are considered midblock as each is marked at either the north or south legal crossing of an intersecting east-west street with the corridor. Three of the crossings, at 7th Ave S, NE 59th St and NE 60th St, are enhanced with rectangular rapid flashing beacons (RRFBs). The crossings at NE 59th St and NE 64th St have overhead pedestrian warning signs in addition to the roadside pedestrian warning signs. All of the crossings in the corridor have pedestrian-carried flags offered for visibility.

## H. On-Street Parking

Currently, there is on-street parking allowable on both sides of Lake Street S/Lake Washington Boulevard NE within the project limits, except south of NE 60th St approaching the signal with Lakeview Drive. There are varying time restrictions throughout the corridor, and no parking restrictions indicated by red curb paint or no parking signs near driveways, crosswalks, intersections, and fire hydrants. There is on-street parking available on both sides of most side streets intersecting the corridor.

## I. Driveways and Off-Street Parking

Off-street public parking is available in Marsh Park and Houghton Beach Park. The remaining off-street parking in the corridor is private. Some of the commercial buildings have off-street lots that are restricted to business users during the day. One commercial building east of Houghton Beach Park makes their off-street lot available for public parking in the evenings. Offstreet parking for residential single and multifamily properties is accessed both by combined driveways leading to parking lots, and head-in driveways in some locations, with multi-stall carports fronting directly onto Lake Street S/Lake Washington Boulevard NE. Several of the driveways on the west side of the corridor have steep approaches to the roadway, which will need to be considered in the design of any changed active mode facilities on the west side of the corridor.

## J. Existing Illumination

Street lighting is present on both sides of the corridor; however, preliminary observations indicate that the existing lighting is not uniform along the corridor. A preliminary lighting study
was performed to calculate the existing light levels. Two metrics were measured for this study: average maintained illuminance, which is a measure of how brightly an area is lit, and uniformity ratio, which is a measure of how evenly an area is lit. Calculation areas were delineated separately throughout the corridor for street segments, intersections, mid-block crossings, and sidewalks. Preliminary findings indicate that there are several areas that could be improved for safety and comfort.

Pedestrian-scale lighting is not currently present along the study portion of Lake Street S/Lake Washington Boulevard NE. Active mode facility enhancements along the corridor will present opportunities to improve both street- and pedestrian-level lighting.

The next phase of the project will consider several issues raised by City staff, such as raising light levels to enhance safety and comfort, avoiding over lighting and glare for residents who live along Lake Street S and Lake Washington Boulevard NE, and determining a mix of existing and new equipment that is forward compatible with existing City equipment.

## K. Utilities

Electrical power in the corridor is underground, with no power utility poles present on either side of the street. There are existing illumination poles, the analysis and details of which is covered under the "Illumination" section. Stormwater conveyance in the corridor has historically been a concern. The corridor is a fairly flat grade, and due to the fast-changing nature of the development along the lakefront, there have been some stormwater systems that have been "dead ended." The enhancement of the corridor will include being opportunistic about identifying solutions to ponding issues where present and identified by City staff.

## IV. SAFETY ANALYSIS

The previous study of the Lake Washington Boulevard NE corridor, included as Attachment B, conducted an analysis of speed in the corridor and a video analytics analysis of near misses at the intersection of Lake Street S and 7th Ave S. The previous study found that speeds in the corridor were aligned with posted limits, and the video analytics analysis of two 13 -hour weekday videos during daylight hours found that overall safety ratings and the rate of near-miss crashes were very low. No safety concerns were identified from this analysis. However, the lack of safety concerns identified in the data is not intended to discount the presence of safety risk factors in the corridor. The video study was conducted over two specific days in favorable weather, and at only one intersection along the corridor. In addition, perceived safety risk and associated comfort can vary based on a users' comfort level with cycling, previous experiences, and day to day use of the corridor. This study will consider both data-based safety analysis to guide specific safety improvements, and subjective estimation of the sense of safety the design changes in the corridor would create to inform evaluation and comparison of alternatives.

## A. Crash Data Review

Transpo Group was provided with five years of recent crash history in the corridor (2016-2020), between the 2nd Avenue $S$ and Lakeview Drive project limits. In reviewing the crash data, the following crash-related patterns of risk factors in crashes, especially in those involving pedestrians or cyclists, were found:

- Crashes involving pedestrians happened more frequently in the dark, both with streetlights on and at dusk prior to streetlights coming on. The pattern of crashes indicates a need for improvements to the street lighting, especially at crosswalks.
- Bicycle-related crashes more frequently involved eastbound turns to the cross streets from both northbound and southbound traffic ( 8 of 12 bike related crashes). There was one (1 of 12) bicycle-related crashes related to driveways.
- Speed of cyclists was cited in 2 crashes as a contributing factor, and
- 3 of 12 bicycle-related crashes were cited as occurring "outside the primary trafficway," indicating possible bike use outside of the bike lanes.

## B. Comparison to the Local Road Safety Plan

The City of Kirkland maintains a Local Road Safety Plan (LRSP) that identifies risk factors for crashes citywide. In the LRSP, crashes that involve pedestrians and cyclists are the top two priorities for the City to develop projects that mitigate risk to vulnerable users. The south end of the Lake Washington Boulevard corridor is identified as a Tier II priority location for LRSP-identified projects, with 4 serious injury crashes in the 5 -year crash data period (2016-2020). The primary identified physical risk factors (i.e. other than driver behavior) in the LRSP on Lake Washington Boulevard are a posted speed over 30 mph , uncontrolled marked crosswalks at intersections, and the turning movements across these same crossings.

## C. Citizen Requests to the City of Kirkland

The City compiled a review of service requests received through Our Kirkland from users of the Lake St S/Lake Washington Boulevard NE corridor since 2018 (post completion of the Lakefront improvements project). Common complaints include overgrown vegetation on sidewalks, trees overhanging the sidewalk or bike lane, tree roots uplifting sidewalks, debris in bike lanes, high speeding traffic or noisy vehicles at night, high traffic volumes in the pm peak, and drivers not yielding to pedestrians at crosswalks. A few location-specific engineering requests include revising signalization and the merge condition at Lakeview Drive, adding lighting and an RRFB to the crosswalk at NE 62nd St, adding an RRFB to the crosswalk at NE 64th St, and adding an RRFB to the crossing at the Aegis Senior Living at 10th Ave S.

## D. Safety Priorities

The linear facilities in the project corridor have, historically, been a low risk for active mode users. The data and analysis completed in the 2021 study (see Attachment B), as well as the City's LRSP, demonstrate the relative safety of the linear facilities. The crosswalks and intersections in the project corridor, on the other hand, do present an opportunity to address crash risk factors. The project team will consider improvements to crosswalks, not just at the locations identified through comments to the City, but at all crossings in the corridor, as part of the promenade project. Addressing visibility of cyclists at intersections will help to address left turn and right hook crashes with cyclists. Consolidating bicycle movements to one facility to the west side of the roadway would addresses crash risk between northbound bicyclists and eastbound vehicle turns.

## V. CROSS-SECTION OPTIONS

The project team, after analyzing the existing conditions and completing a review of the safety data available, developed a range of feasible sections to create a Promenade in the Lake Washington Boulevard corridor. The intent of the exercise of looking at a wide range of sections is
to identify any opportunities that may exist for facilities beyond the originally envisioned widened pedestrian-focused facility. The project team has not conducted a detailed analysis of the pros and cons of each section, and is in the brainstorming phase of the project where all possibilities are considered. The team has focused on creating an all ages and abilities facility for cyclists, and several of the proposed sections also include widening of the existing pedestrian sidewalks. Removal of on-street parking on one side of the corridor provides opportunity to create a more comfortable facility for cyclists of a wide range of abilities and would result in additional space given to pedestrians on a popular walkway. A compilation of the feasible sections, showing various approaches to developing wider, more comfortable active mode spaces both within the existing curbs, and with modifications of the west curb of the roadway, are shown in Attachment A.

The cross-section options are divided into five categories based on the general configuration of the position of the bike facility, the additional treatments provided for pedestrians, the physical protection of the bike facility, and the position of on-street parking retained in the corridor.

As the project team advances the design to apply the cross-sections to alternative corridor plan layouts, transitions between the Promenade section and the existing roadway configuration at the northern and southern limits of the project will be incorporated. In all configurations, the existing lane assignments and number of lanes at the Lakeview Drive intersection will not change, nor will the configuration of lanes north of 2nd Avenue. The final alternative concepts developed by the project team will presented for feedback from the Transportation Commission in December.

## A. Multi-Use Path

The first category of cross-section options would repurpose the existing west side on-street parking lane and both existing on-street bike lanes as a raised multi-use path on the west side. The resulting section would be a very wide promenade dedicated entirely to mixed active mode traffic. The multi-use path would require removal of some existing street trees, to be replaced with new street trees adjacent to the new curb location. The multi-use path would require more significant construction and investment of resources as compared to other options but would meet the overall goal of a new promenade facility.

A lower-cost version of the multiuse path concept would repurpose the existing pavement for the bike lanes and on-street parking into a barrier-separated on-street facility. The barrier between traffic and active modes would be of a material that is less rigid than the curbing for the multi-use path. The repurposed pavement would be available to walking, biking or rolling, but would retain the look and feel of a roadway, which could confuse drivers at driveways and intersecting roadways. A barrier-only conversion for both pedestrian and bicycle traffic could also limit usability by individuals with mobility challenges. A barrier-only conversion would likely only be used as a temporary or demonstration project, or as a phased construction method of designating the promenade while funding for full construction of a raised path is identified.

## B. West Side Parking, Protected Bike Lanes

The second category of modifications to the corridor would combine both bike lanes into a single two-way protected bike lane facility. The two existing bike lanes would be moved to the west curb of Lake Washington Boulevard, and on-street parking would be maintained on the west side of the street. The on-street parking would "float" off the west side curb, providing additional physical separation and space between active travel lanes and the two-way protected bike lanes. Because
on-street parking would be next to the protected lanes in category B , a buffer is required to prevent the threat from "dooring," when parked vehicles open a door into a bicycle facility. The protected lanes could be at roadway level or elevated at sidewalk level. In both cases, there could be opportunities to widen the existing west side sidewalk, while still holding the eastern curb line where it is today. One consideration with category $B$ is that the lower amount of potential on-street parking spaces as compared to maintaining parking on the east side due to a higher number of conflicting driveways, mailboxes, and other protected areas on the west side of the corridor.

## C. East Side Parking, Protected Bike Lanes

The third category also combines the two bike lanes into a single two-way protected bike lane facility on the west side of the corridor. In category C, the on-street parking is provided on the east side. While a buffer is still necessary between the protected bike lanes and the roadway lanes, the buffer is providing physical barrier and separation between cyclists and vehicle lanes, instead of the dooring threat from parked vehicles. Several variations of roadway-level or sidewalk-level protected lanes, and different buffer configurations were developed, along with sections that minimized disturbance to the existing curbs. Sections with minimal disturbance were developed as "proof of concept" configurations that minimize investment of resources and could represent an early stage of implementing the promenade while funding for a widened, sidewalk-level facility are identified.

## D. East Side Parking, Median Separated Protected Bike Lanes

Category D also maintains on-street parking on the east side of the corridor and combines the existing bike lanes into a two-way protected bike lane facility on the west side, but places the bike lanes behind a minimum 5 -foot wide median that is intended to be planted with vegetation that could be used to assist in managing stormwater in the corridor. In category D , as in other category options, the protected lanes could be at roadway level, or could be raised to sidewalk level. At sidewalk level, linear cane detectable raised markings would be used to delineate the pedestrian- and bike-dedicated spaces. A differentiation in pavement type and/or pavement markings could also be used to visually distinguish the protected bike lanes from the sidewalk. The sections in category D with sidewalk-elevation protected lanes closely resemble the Category A multi-use path.

## E. One-Way Protected Bike Lanes

A fifth category of section keeps the existing one-way bike lanes and repurposes one parking lane for additional buffer space for the cyclists. Section concepts include protected bike lanes at roadway grade, and elevated bike lanes with the curbs moved from their existing positions. Placing the northbound bike lane between the curb and parked vehicles provides additional protection for the northbound cyclists, but the risk of dooring from parked vehicles may increase the need for buffer space with category E sections.

## F. Combining Sections

The project team is in the process of combining the sections in each category in plan context to create corridor-length alternatives that would implement the Promenade vision. While implementation of the Category A sections could be a relatively straightforward project within
the corridor; additional benefits for people walking, biking, rolling, in the corridor as well as residents and visitors to the waterfront parks utilizing the on-street parking may be realized through a combination of sections from the other categories.

## VI. EVALUATION OF SECTION OPTIONS

The evaluation of section options will need to consider a wide range of differentiating factors, including variations in the land use and urban design context along the corridor, and a desire for a contiguous look, feel and experience for people walking, biking and rolling on the Lake St S/Lake Washington Boulevard NE corridor. Evaluation criteria will first and foremost focus on the safety and comfort of the design user. Secondary criteria that will be evaluated include the amount of reduced on-street parking, existing residential needs, and the relative cost as it relates to the ability to implement the project. There are a number of other potential considerations that could be used to compare alternatives.

Evaluation criteria could include:

- Mitigation of crash risk factors as demonstrated by crash history
- Inclusion of "quick win" project elements to improve corridor in the near term
- Amount of pedestrian space and bike space
- Visibility and safety for bike traffic at driveways
- Accommodation of mailboxes, trash pickup, and driveways
- Transition between promenade section and existing facilities
- Comfort level for low confidence cyclists
- Accommodation of higher speed/more confident Lake Washington Loop bike traffic
- Physical separation between active mode facility and travel lanes
- Physical separation between active mode facility and on-street parking
- Reduction in on-street parking for residential use
- Reduction in on-street parking for public use
- Implementation cost
- Impact to existing street trees
- Opportunity to improve damaged curbs and sidewalks
- Opportunity to address stormwater concerns

The project team is seeking feedback from the Transportation Commission on the evaluation criteria to ensure that we are evaluating section and corridor options and alternatives in a way that matches the public's desires and meets the needs of the City's users and residents.

## VII. ON-STREET PARKING MANAGEMENT STRATEGIES

To address the reduction of on-street parking that the promenade concept would require, several parking management strategies were identified that could help to mitigate the impact of the change in parking supply, while maintaining local access to parks, residences, and businesses. For each management strategy, a high-level assessment of advantages and disadvantages is presented for discussion and feedback. In general, it is assumed that the side streets connecting to Lake St S/Lake Washington Boulevard NE have adequate on-street
parking for residents and to absorb the total demand for on-street parking. Tables documenting observed parking compared to the available spaces on and adjacent to the corridor are included in the 2021 parking study, Attachment B.

The parking strategies listed below are presented only for Transportation Commission consideration and feedback. No strategies have been evaluated for recommendation, and a combination of strategies may ultimately be recommended. Note that as part of a separate initiative, the City is evaluating technologies to monitor the use of on-street and off-street public parking Downtown that could be applied to the Lake St S/Lake Washington Blvd NE corridor.

## A. Wayfinding Signage

The lowest cost and simplest strategy would be placement of wayfinding signage along Lake Street and Lake Washington Boulevard, directing those looking for parking to the side streets where parking is available similar to recently implemented wayfinding for Downtown.

General advantages of wayfinding signage as a parking management strategy are the low cost, low impact on corridor design, and ease of maintenance. A disadvantage of wayfinding signage could be sign "clutter" and that signage may not be readily visible to those looking for parking in a very localized and specific spot, such as in front of a residence where a delivery or rideshare drop-off is being conducted.

Wayfinding signage can be used as a parking management strategy on its own, or in combination with the other strategies listed below.

## B. Time-Restricted Parking

Changing or implementing time-restrictions for the on-street parking along Lake Street and Lake Washington Boulevard would help to manage the availability of spaces by encouraging short term use and greater turn over at the parks and businesses in the corridor. Timerestricted parking does affect the usefulness to residents who typically have longer parking requirements for guests or for their own vehicles, in excess of typical time restrictions. Timerestricted parking requires enforcement, in addition to regularly spaced signage to ensure awareness of the limitations. Enforcement and sign maintenance are a long-term cost to the City of time-restricted parking. Some time-restricted parking is already present in the corridor, on the north end of the limits near 2nd Avenue. A balance of time-restricted parking in areas more likely to generate public parking requirements, such as near parks, with unrestricted parking intended for residents near residential areas, such as between 2nd and 7th Avenues, is a potential parking management strategy to consider.

## C. Permit Zones

City does not have a permit parking zone policy to restrict public parking. Generally, restricted parking zones may result in spill over parking problems on adjacent streets, and the City does not have the resources to manage and enforce restricted parking zones.

While permitted parking could be a management technique to help guarantee availability of onstreet parking for residents and/or businesses who apply for permits, there are a number of secondary implications. A permit zone system would require comprehensive application of clear signage on the corridor and may even require signage on side streets. Long-term costs for additional parking enforcement officers of a permit zone, and well as required resources to manage application review, distribution, and monitoring system by the City would be incurred to maintain a permit system.

Moreover, a permit parking system would likely reduce the availability of public parking for park access, trail access, and general business access from on-street parking. Permits may present equity concerns given reduced public availability of spaces or costs associated with obtaining a permit. Turnover among residents and/or redevelopment of residential properties could introduce further complications with a permit parking system. Wait times for permit processing among new residents could lead to parking violations and frustration among residents.

## D. Time-Restricted Off-Street Lot

Changing existing parking time restrictions on the off-street lots for the parks and/or investigating the possibility of an additional off-street public lot with time-restricted parking could be options to provide additional public parking. There would be similar ongoing costs for enforcement and maintenance to the corridor-wide time restricted parking option. Obtaining City ownership of an off-street lot would be a significant capital expense and unlikely near-term possibility given the desirability of property near the lakefront. Partnerships for public use of existing private lots, such as the Life Community Church north of 5th Avenue, or for commercial buildings near the south end of the corridor could be more practical opportunities for timerestricted off-street parking.

The existing commercial building lot between 58th and 59th Streets, across from Houghton Beach Park is a private lot that operates as a time-restricted lot. Signage in the lot indicates that the spaces are available on evenings and weekends for public park access but are restricted during daytime business hour use.

## E. Combined Time-Restricted and Permit Zones

One context specific parking management strategy would be to combine time restricted and permit zones along the corridor. Time-restrictions would be put in place more on the south half of the corridor, between Marsh Park and Houghton Beach Park, while north of 10th Avenue, permit zones would be in place. The permit zones would allow additional parking in the areas where residences are more of the land use, while the time-restricted zones are matched to the more public uses of the two larger parks.

The disadvantage of this approach, although it does provide for a good context-sensitive match to the on-street parking needs, is that the long-term costs to the City may be the highest of all the approaches. The City would need to maintain enforcement for both time-restricted parking and permit use, as well as maintain a permitting department and internal permit management.

## VIII. NEXT STEPS:

Staff and Transpo Group will return to Transportation Commission in December of 2022 with a completed analysis of options. At that time, feedback from the Transportation Commission will be incorporated into the analysis before the evaluation of options is presented to the Kirkland City Council in early 2023.

## MEMORANDUM

| Date: | December 2, 2021 | TG: | 21184.00 |
| :--- | :--- | :--- | :--- |
| To: | Joel Pfundt, AICP |  |  |
| From: | Paul Sharman, PE |  |  |
|  | Patrick Lynch, AICP |  |  |
| cc: | Iris Cabrera, Sierra Ohlsen |  |  |
| Subject: | Kirkland Parking Data Collection |  |  |

The City of Kirkland is evaluating creation of a pedestrian walkway/promenade along Lake Street S/Lake Washington Boulevard between 2nd Ave S and NE 60th Street. This would require the elimination of existing on-street parking spaces along one side of the roadway. To better understand the impacts of this proposal, the city is seeking to:

- Evaluate the safety benefits and impacts,
- Evaluate vehicle parking impacts, and
- Evaluate changes in how people use the waterfront

To accomplish these goals, parking and multimodal activity data along the Lake Street S/Lake Washington Boulevard corridor were collected. In addition, Streetlight Data was used to understand the travel patterns for those who park within the study area. The study area is shown in Figure 1. The purpose of this memorandum is to summarize the parking, vehicle and multimodal data collected and highlight how potential removal of on-street parking along Lake Washington Blvd may impact travel within the study area.

## Study Area Characteristics

The study area is generally bounded by 2nd Avenue

Figure 1 - Study Area South on the north, and NE 60th Street on the south and State Street / NE 68th Avenue to the east. Lake Street / Lake Washington Boulevard is the primary corridor of interest, a 0.9 mile segment whose speed limit is 30 mph south of approximately 7th Avenue South, and 25 mph to the north. The study area included 8 'side-streets' where parking spillover from Lake Washington Boulevard / Lake Street was likely and three additional off-street parking lots (Marsh Park, Houghton Beach Lot, and 58th Street Lot). The side streets included NE 62nd Street, NE 63rd Street, NE 64th Street, 10th Avenue S, 7th Avenue S, 5th Avenue South, 2nd Avenue S and 2nd Street S. Many of these side streets running perpendicular to Lake Washington Boulevard / Lake Street have steep inclines that may prove difficult to navigate for those with mobility challenges. Based on City of

Kirkland estimates, the study area includes approximately 645 parking spaces, 295 of which are located on Lake Washington Boulevard / Lake Street.

The following sections summarize the traffic data collected.

## Pneumatic Tube Count Data Collection

72-hour tube data was collected at three locations along Lake Street / Lake Washington Boulevard. The first, at Lake Street south of the 7th Avenue crossing, another at Lake Washington Boulevard south of the Marsh Park crossing, and lastly at Lake Washington Boulevard north of the NE 60th Street crossing. The data was collected continuously from Thursday, July 22nd to the end of the day Sunday, July 25th, 2021. Speed and volume data are summarized in the following sections below.

## Speed Observations

The following section summarizes the speed for vehicles travelling along Lake Street / Lake Washington Boulevard at the three study locations. The speeds are broken out into speed bins and averaged across the three days of data collection (Thursday, Friday, Saturday). Raw speed data can be found along with other traffic count data in Appendix B.

## Lake Street South of 7th Avenue Crossing

Figure 2 summarizes the average speeds just south of 7th Avenue on Lake Street.

Figure 2. 7th Avenue Distribution of Vehicle Speeds (Avg Thur-Sat)
As shown in Figure 2, most vehicles traveled at speeds between 20-30 miles per hour. The average speed was 24.7 miles per hour, with an 85 th percentile speed of 29.6 miles per hour. The speed limit on this section of roadway transitions from 30 miles per hour south of the crossing to 25 miles per hour north of the crossing.

## Lake Washington Boulevard South of Marsh Park Crossing

Figure 3 summarizes the average speeds on Lake Washington Boulevard just south of Marsh Park.

Figure 3. Marsh Park Distribution of Vehicle Speeds (Avg Thur-Sat)
As shown in Figure 4, most vehicles traveled at speeds between 20-30 miles per hour. The average speed was 25.5 miles per hour, with an 85th percentile speed of 30.8 miles per hour. The speed limit on this section of roadway is 30 miles per hour throughout.

## Lake Washington Boulevard North of NE 60th Street Crossing

Figure 4 summarizes the three-day average speeds on Lake Washington Boulevard north of NE 60th Street.

Figure 4. NE 60th Street Distribution of Vehicle Speeds (Avg Thur-Sat)
As shown in Figure 4, most vehicles traveled at speeds between 20-30 miles per hour. The average speed was 25.1 miles per hour, with an 85 th percentile speed of 31.1 miles per hour. The speed limit on this section of roadway is 30 miles per hour throughout.

## Speed Data Summary

The collected data suggests that the average measured speeds meet the speed limits along all segments of roadway. Speeds gradually increase from north to south, and the 85th percentile speed hovers around $30-31$ miles per hour for the studied segments. Table 1 summarizes the average and 85 th percentile speeds for each location.

Table 1. Speed Data Summary

| Location | Average Speed (mph) | 85th Percentile Speed (mph) |
| :--- | :---: | :---: |
| Lake St South of 7th Ave Crossing | 24.7 | 29.6 |
| Lake Washington Blvd South of Marsh Park Crossing | 25.5 | 30.8 |
| Lake Washington Blvd North of NE 60th St Crossing | 25.1 | 31.1 |
| Average | $\mathbf{2 5 . 1}$ | $\mathbf{3 0 . 5}$ |

## Volume Data

This section summarizes the hourly average volume data taken at the three study locations for Thursday, Friday, and Saturday. Directional volumes can be found for all days and locations in Appendix A.

## Lake Street South of 7th Avenue Crossing

Figure 5 summarizes the hourly traffic volumes on Lake Street south of 7th Avenue.

Figure 5. 7th Avenue Hourly Volumes by Day
Hourly traffic volumes trends on Thursday and Friday are generally comparable. Volumes start increasing at 6:00 AM and peak midafternoon ( $\sim 3: 00-4: 00 \mathrm{PM}$ ) before steadily decreasing as the day goes on. Generally, similar trends are seen on Saturday and Sunday, but weekend volumes tend to at 1:00 PM. Volumes throughout the day on the weekend tend to be lower than during the week. Evening volumes on Saturday and Sunday are comparably to weekday volumes.

## Lake Washington Boulevard South of Marsh Park Crossing

Figure 6 summarizes the data collected at this location.

Figure 6. Marsh Park Hourly Volumes by Day
Volumes for Thursday and Friday are comparable for most of the day, excluding the early afternoon when Thursday volumes peaked higher than Friday volumes from 12:00-3:00 PM. The Saturday volumes begin increasing at a much slower rate in the morning but are generally comparable for the rest of the day. The different days follow similar trends throughout the day in terms of when they increase, peak, and decrease.

## Lake Washington Boulevard North of NE 60th Street Crossing

Figure 7 summarizes the data collected at this location.

Figure 7. NE 60th Street Hourly Volumes by Day
The data collected at this location is similar to the data near the Marsh Park crossing. Each of the days follow the same trends described for the Marsh Park data. One minor exception is that the Friday data near Marsh Park gradually increases to a peak at 3:00 PM, then gradually decreases throughout the rest of the day. At NE 60th Street, the volumes are relatively similar from 12:00 PM to 5:00 PM, then there is a significant drop at 6:00 PM before gradually decreasing for the rest of the evening.

## Volume Data Summary

For most of the Thursday and Friday counts, the peak occurs between 3:00-4:00 PM, whereas the Saturday and Sunday counts typically peak earlier in the day between 1:00-3:00 PM. Before the peak period, the greatest volumes generally occurred on Thursday. During the peak period, the greatest volumes generally occurred on Friday. After the peak period, volumes for Friday and Saturday were typically similar and greater than Thursday volumes. Graphs for each of the individual days at each location showing the northbound, southbound, and total splits are shown in Appendix A. Average daily volumes for each location are summarized below in Table 2.

Table 2. Average Daily Volumes

|  | Average Weekday Daily Volume |  | Average Saturday Daily Volume |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Location | Northbound | Southbound | Total | Northbound | Southbound | Total |
| Lake St South of 7th <br> Ave Crossing | 5,935 | 6,670 | 12,405 | 5,110 | 5,300 | 10,410 |
| Lake Washington Blvd <br> South of Marsh Park <br> Crossing | 6,215 | 6,450 | 12,665 | 5,915 | 5,705 | 11,620 |
| Lake Washington Blvd <br> North of NE 60th St <br> Crossing <br> Average | 6,310 | 6,800 | 13,110 | 5,910 | 5,920 | 11,830 |

## Pedestrian and Bicycle Data Collection

Pedestrian and bicycle counts were collected at three locations along Lake Street and Lake Washington Boulevard. The first, at the Lake Street/7th Avenue South crossing, another at the Lake Washington
Boulevard/Marsh Park crossing, and lastly at the Lake Washington Boulevard NE/NE 60th Street crossing. The collection areas are shown on Figure 7. At each crossing, the number of pedestrians and bicyclists who traveled northbound, southbound, eastbound, and westbound were counted. The data was collected continuously on Thursday, July 22nd and Saturday, July 24th, 2021, from 9:00 AM until 9:00 PM. Weather during both days was warm and sunny, with highs of 75 and 82 on Thursday and Saturday, respectively. The count data is summarized in the following sections below.

## Lake Street \& 7th Avenue South

On Thursday, the number of pedestrians counted varied between 20 and 40 per 15-minute increment while cyclist counts fluctuate between 0 and 20 throughout most of the day. However, pedestrian activity began increasing around 4:30 PM, with pedestrian counts peaking at 6:45 PM when 95 pedestrians were counted within 15 minutes. Bicycle counts did not increase in the evening. On Thursday, 47 percent of pedestrians travelled northbound, while 53 percent of bicyclists travelled southbound. On Saturday, the volume of pedestrian and bicycle counts peaked several times throughout the day. Between 11:30 and 11:45 AM, 88 pedestrians and 31 cyclists were counted while 112 pedestrians and 6 bicyclists were counted between 8:00 and 8:15 PM. Most pedestrians and cyclists travelled northbound at 48 and 51 percent, respectively. The bicycle and pedestrian counts for Thursday and Saturday are shown on Figure 9 and Figure 10.

Figure 9. Lake Street \& 7th Avenue South Thursday (7/22) Collection Data

Figure 10. Lake Street \& 7th Avenue South Saturday (7/24) Collection Data

## Lake Washington Boulevard \& Marsh Park

Similar to the counts on 7th Avenue, on Thursday, the pedestrian and bicycle counts remains steady between 20 and 40 pedestrians and 0 and 20 cyclists throughout most of the day until 7:00 PM with 62 pedestrians and 10 cyclists counted. Of the data collected on Thursday, most pedestrians travelled northbound, at 47 percent, and most bicyclists travelled southbound, at 52 percent. On Saturday, there are several peaks throughout the day with volumes ranging from a low of 25 people to the AM peak which counted 61 pedestrians and 26 cyclists at 11:15 AM. The PM peak counted 63 pedestrians and 3 bicyclists and occurred at 8:45 PM. Most pedestrians and cyclists travelled southbound at 46 percent and 50 percent respectively. The data are shown on Figure 11 and Figure 12.

Figure 11. Lake Washington Boulevard \& Marsh Park Thursday (7/22) Collection Data

Figure 12. Lake Washington Boulevard \& Marsh Park Saturday (7/24) Collection Data

## Lake Washington Boulevard NE \& NE 60th Street

On Thursday, the data remains steady between 15 and 40 pedestrians and 0 and 15 cyclists until it peaks at $7: 15 \mathrm{PM}$ with 61 pedestrians and 8 cyclists counted. Of the data collected on Thursday, the most pedestrians were split traveling northbound and southbound at 44 percent each, and most bicyclists travelled southbound, at 55 percent. On Saturday, there are several peaks throughout the day with volumes ranging from a low of 35 people to the AM peak which counted 71 pedestrians and 27 cyclists at 11:00 AM. The PM peak counted 67 pedestrians and 10 bicyclists and occurred at 8:15 PM. Most pedestrians and cyclists travelled southbound at 42 percent and 51 percent respectively. The data is shown on Figures 12 and 13.

Figure 13. Lake Washington Boulevard NE \& NE 60th Street Thursday (7/22) Collection Data

Figure 14. Lake Washington Boulevard NE \& NE 60th Street Saturday (7/24) Collection Data

Generally, pedestrian and bicycle volumes tend to be higher on Saturday than on Thursday, with volumes slightly higher at the north end of the study area (at 7th Avenue) than at the other count locations. Bicycle and pedestrian volumes primarily travel north-south along the corridor, with few people crossing the street at the three study locations.

Table 3 summarizes the nonmotorized volumes on Thursday and Saturday at each of the data collection locations. On average, the corridor sees approximately 1,890 nonmotorized users on Thursday and 2,950 users on Saturday.

Table 3. Nonmotorized Volume Summary

|  | Average Weekday Daily Volume |  | Average Saturday Daily Volume |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Location | Pedestrians | Bicycles | Total | Pedestrians | Bicycles | Total |
| Lake St South of 7th <br> Ave Crossing | 2036 | 280 | 2316 | 2786 | 615 | 3401 |
| Lake Washington Blvd <br> South of Marsh Park <br> Crossing <br> Lake Washington Blvd <br> North of NE 60th St <br> Crossing <br> Average 1388 | 289 | 1677 | 1953 | 640 | 2593 |  |

Comparing the number of multimodal users in Table 3 to the vehicle volumes shown in Table 2 show that a relatively large portion of the roadway users are pedestrian and bicyclists. Assuming an average vehicle occupancy of 1.2, there are approximately 15,270 and 13,540 people traveling along the corridor in cars on Thursday and Saturday, respectively. This would translate to a multimodal mode share of approximately 11 percent on Thursday and 18 percent on the weekend.

## Parking Data Collection

Parking data was collected at both the on-street (Lake Street and Lake Washington Boulevard) and off-street locations within the study area on Thursday and Saturday at regularly spaced threeto four-hour increments. On Thursday, parking counts were conducted at 9AM, 12PM, 4PM and 7PM, while the Saturday counts were conducted at 10AM, 1PM, 4PM and 7PM. The study area is shown in Figure 15. Parking was collected along 45 blocks and three off-street parking lots. The on-street parking supply was provided by City of Kirkland staff and estimated as one parking space per 20 linear feet, totaling approximately 576 parking spaces within the study area. Across the three off-street lots, a total of 69 parking stalls were surveyed.

Hourly total volumes of parked cars across the study area are shown on Figure 16 and Figure 17 for Thursday and Saturday, respectively.

Figure 15 - Parking Data Collection Locations

Figure 16 - Thursday (7/22) Parking Occupancy

Figure 17 - Saturday (7/24) Parking Occupancy

As shown in Figure 16, the number of parked vehicles fluctuated throughout the day, with peaks at noon and at 7PM. At noon there were 277 on-street and 55 off-street vehicles while at 7:00 PM there were 316 on-street and 46 off-street vehicles. The on-street parking data shows an overall study area occupancy of 42 percent and 56 percent for the midday and evening peaks respectively.

On Saturday (as shown in Figure 17) the number of parked vehicles peaked at 4:00 PM. At this time, there were 361 on-street and 69 off-street vehicles counted - both the largest numbers seen in the duration of this this study. This is representative of an on-street parking occupancy of 60 percent and an off-street occupancy of 100 percent, totaling 67 percent of all spaces.

Table 4 shows the estimated parking occupancy for the total study area during all data collection periods.

| Table 4. Day | Total Study Area Parking Occupancy |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 9:00 AM | 10:00 AM | 12:00 PM | 1:00 PM | 4:00 PM | 7:00 PM |
| Thursday | 41\% | - | 52\% | - | 45\% | 56\% |
| Saturday | - | 37\% | - | 59\% | 67\% | 62\% |

To understand the implications of potential removal of on-street parking along Lake Washington Boulevard / Lake Street, the total on-street parking occupancy along Lake Street / Lake Washington Boulevard is summarized in Table 5.

| Table 5. <br> Day | Lake WA Blvd / Lake St On-Street Parking Occupancy |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 9:00 AM | $\mathbf{1 0 : 0 0 ~ A M ~}$ | $\mathbf{1 2 : 0 0 ~ P M ~}$ | 1:00 PM | 4:00 PM | 7:00 PM |  |
| Thursday | $33 \%$ | - | $43 \%$ | - | $41 \%$ | $57 \%$ |
| Saturday | - | $28 \%$ | - | $54 \%$ | $62 \%$ | $56 \%$ |

Occupancy levels along Lake Washington Boulevard / Lake Street would need to be below 50 percent to avoid parking spillback into the rest of the study area. On-street parking occupancy crosses 50 percent along the corridor during four of the eight periods of data collection, indicating that removal of half the on-street parking supply would likely result in parking spillback onto other neighboring side streets on both weekdays and weekends.

The overall study area occupancy assuming half the on-street parking spaces (approximately 143) were removed from the Lake Washington Boulevard / Lake Street Corridor is summarized in Table 6.

| Table 6. | Study Area Occupancy Assuming Removal of half on-street spaces along Lake WA Blvd |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Day | 9:00 AM | 10:00 AM | 12:00 PM | 1:00 PM | 4:00 PM | 7:00 PM |
| Thursday | 53\% | - | 67\% | - | 59\% | 73\% |
| Saturday | - | 48\% | - | 76\% | 87\% | 81\% |

This indicates that there would be adequate supply to accommodate existing parking demand if half the spaces along the Lake Washington Boulevard / Lake Street corridor were removed. However, during the afternoon and evening on Saturdays, parking may be difficult to find when occupancy reaches over 80 percent. While the total demand could be accommodated, there would likely be specific locations where parking demand would exceed supply.

To understand the distribution of parking demand on a block-by-block basis, a map was created for each of the time periods of data collection. All eight maps can be found in Appendix C. These maps highlight both when and where existing parking occupancy is constrained. During the week, the northern section of Lake Street and the southern section of Lake Washington Boulevard generally experience the highest occupancy levels, of which some blocks are fully occupied. The section of on-street parking along Lake Street and Lake Washington Boulevard from 7th Avenue South to NE 62nd Street is at less than 55 percent occupancy for most of the day.

The Saturday counts showed that the northern section of Lake Street and the southern section of Lake Washington Boulevard follow similar trends as the data collected on Thursday. The section between 7th Avenue South and NE 62nd Street, however, showed much higher levels of occupancy on Saturday than Thursday.

## Parking Origin Destination

To better understand parking behavior within the study area, the project team sought to understand trip characteristics of those who park within the study area. To accomplish this, data was purchased from Streetlight Data, a company who collects GPS and location-based services (LBS) data from a variety of sources to understand travel behavior. The study area was broken out into 10 'zones' for which origin and destination data was collected. However, because Streetlight Data relies on a small subset of the overall vehicle volumes and some of the zones were small, the zones were aggregated up to three larger zones, as shown in Figure 18. For each of the three zones (northern, central, and southern) average trip length was measured within the Streetlight Data platform. Trip length was used to estimate the number of trips made by Kirkland residents as compared to visitors.

The trip length data for each section was sorted in data ranges of less than one mile, one to two miles, two to five miles, or more than five miles. The percent distribution of trip lengths is shown in Table 7.

Figure 18. Streetlight Data Zone Configuration

Table 7. Percentage of Trips by Trip Length

|  | Weekday Trip Length Percentage |  |  | Saturday Trip Length Percentage |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Location | < $\mathbf{~ M i l e}$ | 1-2 Miles | 2-5 Miles | 5+ Miles | <1 Mile | 1-2 Miles | 2-5 Miles | 5+ Miles |
| Northern Zone | $23 \%$ | $11 \%$ | $25 \%$ | $41 \%$ | $16 \%$ | $16 \%$ | $19 \%$ | $49 \%$ |
| Central Zone | $14 \%$ | $13 \%$ | $31 \%$ | $42 \%$ | $21 \%$ | $12 \%$ | $21 \%$ | $46 \%$ |
| Southern Zone | $8 \%$ | $9 \%$ | $35 \%$ | $48 \%$ | $11 \%$ | $16 \%$ | $18 \%$ | $55 \%$ |
| Entire Study Area | $15 \%$ | $11 \%$ | $30 \%$ | $44 \%$ | $17 \%$ | $14 \%$ | $20 \%$ | $49 \%$ |

## Northern Zone

The northern zone sees most of its trips originating from less than five miles away during the weekdays ( 59 percent), whereas the distribution is more evenly split on Saturday at 51 percent of trips being less than five miles in length. On weekdays, nearly a quarter of all trips are less than a mile in length, and a quarter are in the range of two to five miles which indicates that many of the vehicles that park in the northern zone may be local residents. On Saturday, more trips come from more than five miles away, indicating more visitors to the downtown area on Saturdays than during the week.

## Central Zone

During the weekdays, most trips originate from less than five miles away ( 58 percent), but the distribution is more evenly split on Saturday at 54 percent, much like the northern zone. On weekdays, the trip length is weighted to further distances, with only 27 percent of trips originating from less than two miles away. On Saturday, 21 percent of trips are less than one mile, indicating that Kirkland residents may be travelling down to the waterfront and parking.

## Southern Zone

Trips to the southern zone on weekdays are mostly split between less than or greater than five miles in length at 52 percent and 48 percent respectively. Breaking down into the smaller bins, however, shows that 82 percent of trips originated from more than two miles away. The Saturday data is more evenly split, however, with 11 percent, 16 percent, and 18 percent for the less than one mile, one to two mile, and two to five mile categories respectively.

## Full Study Area

For the weekdays, 57 percent of trips originated from less than five miles away, 15 percent of which were less than a mile in length. 12 percent of trips were in the one to two mile range, and 30 percent were in the two to five mile range. The Saturday data is more evenly split, however, with 17 percent, 15 percent, and 19 percent for the less than one mile, one to two mile, and two to five mile categories respectively.

## Safety and Near Miss Video Analysis

To better understand the impacts of increased multimodal activity along the Lake Washington Boulevard / Lake Street corridor, the project team sought to conduct a review of the existing conditions. The project team contacted Transoft Solutions, the maker of video analytics software that analyzes both collision and near-miss incidents to establish a safety profile of the site. Transoft was willing to do a pilot analysis of one of the video feeds, and the city staff selected the video footage of the Lake Washington Boulevard / 7th Avenue intersection for analysis. The project team uploaded 26 hours of video footage (13 hours on Thursday and 13 hours on Saturday) that was processed through Transoft's online video analysis platform.

The software uses machine-learning to analyze near misses, by categorizing all roadway users and calculating when they occupied the same space. The system analyzes both vehicle-vehicle interactions as well as vehicle-multimodal user interactions as long as they are within the video frame. This process is shown for a sample conflict between a pedestrian and vehicle below in Figure 19.

Figure 19 - Sample Conflict in Transoft Video Analytics

Figure 20 provides an overall summary of the safety results generated from the Transoft video analytics software.

Figure 20 - Safety Analysis Overview of 7th Avenue
Overall safety indicator was categories as relatively safe, as the average safety indicated value was 6.2 (on a 0 to 7.5 scale). This indicates the average time between two roadway users making conflicting movements (i.e., pedestrian in the crosswalk and a vehicle) occupying the same space and a higher value equates to a safer location. The video footage estimated approximately 28 'safety events' per hour, which means that two roadway users occupied the same space within 7.5 seconds of one another. However, the critical conflict rates were well below 1 percent with the nearest miss occurring during a harsh braking event when two vehicles occupied the same space within 0.9 seconds. The nearest-miss conflict between vehicle and pedestrian was 2.3 seconds (shown in Figure 19) and does not score as a critical event within the software analysis.

Both the Swedish and DDRT Critical Conflict Rate calculations are methods of estimating the likelihood of a roadway user getting into a conflict. The DDRT (Desired Design Reaction Time) methodology uses the time between conflict points and design reaction times to measure risk. The Swedish Methodology uses a causal relationship between conflicts and crashes to estimate the likelihood of a collision.

The video analytics software also identified approximately 7,100 speeding events (any vehicle traveling more than 25 MPH ). The breakdown of those speeds is summarized in Figure 21.

Figure 21 - Speeding Event Summary
The distribution of speeding events captured by the video analytics platform shows that approximately 33 percent of vehicles travel between 26 and 33 MPH , while only approximately 5 percent of vehicles travel more than 30 MPH. While the raw number of speeding events seems high, the distribution shows that there is not a speeding problem (as previously shown in Table 1).

The Transoft video analytics platform showed that most near misses were vehicle-vehicle conflicts when a quick breaking event occurred. The platform did not identify any major safety issues at this site.

## Summary and Next Steps

The purpose of this memorandum was to summarize the data collected to understand the parking demands within the Lake Washington Boulevard / Lake Street corridor and on the adjacent side streets as well as the level of vehicle and multimodal activity along the corridor. The following summarizes the primary findings of the parking and multimodal data analysis.

- The Lake Washington Boulevard / Lake Street Corridor has high pedestrian and bicycle activity.
- Nonmotorized activity is highest on Saturdays, but Thursday evenings see times of high activity as well
- There are multiple periods of time on both Thursdays and Saturdays where 200 to 300 pedestrians use the corridor each hour.
- Bicycle volumes peak at approximately 80 per hour on Saturday mornings.
- Traffic speed data shows that there are no major speeding issues along the corridor
- Traffic counts show an average weekday daily traffic of approximately 12,700 vehicles per day, with approximately 11,300 vehicles on Saturday
- Assuming an average vehicle occupancy of 1.2 , this would translate to a multimodal mode share of approximately 11 percent on Thursday and 18 percent on the weekend.
- Overall parking demand in the study area was highest on Saturdays, with a peak overall occupancy of approximately 67 percent.
- While overall supply was able to accommodate demand, the north end of the study area is much busier, with some blocks consistently fully occupied.
- Elimination of parking along one side of the Lake Washington Boulevard / Lake Street corridor would likely cause increased parking spillback into neighboring side streets, but the parking supply within the study area is expected to accommodate the demand.
- Both the north and south end of the study area would likely be fully occupied and would require users to park further away from their destination
- The Streetlight Data showed that a sizeable percentage of trips to the waterfront are less than one mile in length, and thus likely taken by Kirkland residents, especially on Thursdays.
- This is especially true for the Northern Zone, just south of the Kirkland downtown area.
- Given the high number of short trips, it is likely that if parking within the study area was further constrained, some of these trips may switch to walking or biking.
- The video safety analysis conducted by Transoft Solutions showed no collisions and few reoccurring safety issues. Most near-misses were identified as harsh breaking events and overall site safety was relatively high.

Based on the results of the data analysis presented within this memorandum, Kirkland staff will work to evaluate whether removal of on-street parking along the Lake Washington Boulevard / Lake Street corridor is warranted to install enhanced non-motorized facilities.
